## TOSHIBA PROUDLY LAUNCHES REMOTRADAR MONITORING PROGRAM

**Toshiba International Corporation, August 21, 2009** -- Toshiba International Corporation's Uninterruptible Power Systems (UPS) is pleased to announce that its new RemotRadar™ monitoring program, which was initially launched in June 2009, is now available for immediate purchase and download at [www.toshibaups.com](http://www.toshibaups.com). RemotRadar™ is a software application that runs under the Windows operating system and is used for internet monitoring of Toshiba uninterruptible power systems equipped with RemotEyeII® or Remote-D®. This competitively priced device allows for automatic detection of RemotEyeII® and Remote-D® on the network and easy load into the user's software database.

RemotRadar™ allows for real-time monitoring, auto-tracking, auto-reporting, customizing alarms, and managing of up to 1,024 RemotEyeII® or Remote-D® devices at once. Event alert messages can be sent to any specified email address or cellular text message service. Its web-based interface even permits this monitoring across global locations. RemotRadar™ devices may be grouped hierarchically up to eight levels deep.

Toshiba's RemotRadar™ is currently available in softcopy format for \$799 and in a hardcopy CD format for \$869. Customers can order the product from the Toshiba website in either a) soft copy, in which the customer will be prompted to download the program or b) hard copy, in which the order will be entered into the system and then the CD will be shipped from Toshiba's warehouse. Customers are also able to order the software through a purchase order. Even with purchase orders, customers can choose either soft or hard copy versions of the download.

Regardless of which option is selected, registering the RemotRadar™ program with Toshiba can be done in three easy steps. The registration guide is included with both the downloadable file and the CD version of the program and Toshiba will supply the registration key.

With over 20 years experience in the uninterruptible power systems arena, Toshiba produces a versatile range of one and three-phase uninterruptible power system solutions and accessories that are hallmarked for their outstanding performance and reliability. TIC produces single-phase uninterruptible power system models ranging from 1 to 22 KVA, three-phase single module systems ranging from 15 to 750 KVA, and three-phase parallel module systems ranging from 100 to 3000 KVA. These systems are suitable for a wide range of applications including data centers, telecommunication, healthcare, and broadcasting just to name a few.

Toshiba International Corporation, located in Houston, Texas, is a Toshiba America Inc. (TAI) Group Company, a wholly-owned subsidiary of Toshiba Corporation, and is a world leader in the design and manufacture of uninterruptible power systems, adjustable speeds drives, motors, motor controls, LED displays, and network and automation system products. TIC has a proud tradition of quality, innovation, reliability, and a commitment to customer service. Our designs are manufactured from start to finish using only the highest quality domestic and foreign parts.
